

Top Performer Badge Handoff

This document describes the deployed Supabase Edge Function for the Top Performer badge and the files included in the function bundle.

Deployed function files:

index.ts

evaluators/topPerformer.ts

metrics/completion.ts

metrics/ratings.ts

What the function does:

1. Accepts a worker_id from the request payload.
2. Evaluates whether the worker qualifies for the Top Performer badge.
3. Checks the score inputs used by the evaluator and metrics files.
4. Writes the badge assignment to the database in worker_badges table when the worker qualifies.
5. Returns a success or failure response for the caller.

How the files fit together:

index.ts is the entry point and coordinates the request flow.

evaluators/topPerformer.ts contains the badge decision logic.

metrics/completion.ts contributes completion-related scoring.

metrics/ratings.ts contributes rating-related scoring.

How to test:

1. Run the local test script to call the deployed endpoint.
2. Confirm the edge function logs show a successful request.
3. Verify the expected row exists in public.worker_badges.
